PHOENIX® LAUNCHES MODULAR LED DOCK LIGHT

MILWAUKEE, WI USA – Phoenix Products Company, Inc. is pleased to announce the launch of its new Modular LED *docklite*® head.

The new Phoenix Modular LED *docklite*®, powered by only 16 watts, is far more energy efficient than the standard incandescent dock light using a 150 watt lamp. With a long-life, solid-state light source the fixture is extremely durable and more likely to survive an accidental impact. Compared to a standard dock light, the LED head delivers brighter and more uniform light to the nose of a 53' trailer. The modular head can be easily retrofitted to almost any brand of dock arm.

Phoenix Products Company, Inc. invented dock lighting in 1961. Since then, Phoenix has developed one of the broadest lines of dock lights and has emerged as the industry leader. The line offers extreme durability, with corrosion-resistant construction. A modular ordering system makes replacement and field adjustments less costly and more convenient for Phoenix customers. In addition to the traditional dock lighting, Phoenix offers a wide variety of lamp choices, mounting methods, accessories, and special application dock lights.
